

# Microsoft Agent Framework (MAF)

## Technical Specification: Dedicated MAF Agent Role & Responsibilities

**EXECUTIVE PURPOSE:** In this project, the Microsoft Agent Framework (MAF) Agent serves as the central cognitive orchestrator. It bridges conversational intake in Microsoft Teams with enterprise execution across direct REST APIs, Microsoft Graph, and unattended RPA workflows (Power Automate / UiPath), ensuring full compliance, policy verification, and autonomous closure in ServiceNow.

### 1. Target Architecture & End-to-End Workflow Mapping

### 2. Core Responsibilities of the MAF Agent

| Functional Domain                       | Specific MAF Agent Responsibilities                                                                                                                                                                                                                  |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1. Intent Understanding & Triage        | Interprets conversational requests in Microsoft Teams. Performs slot-filling to gather required parameters (target role, justification, system). Classifies requests into standard ITIL categories and creates records in ServiceNow.                |
| 2. Policy & Risk Governance             | Evaluates Segregation of Duties (SoD) conflicts, department eligibility, and risk levels. Dispatches interactive Adaptive Cards to approvers in Teams for elevated requests or auto-approves zero-risk items.                                        |
| 3. Fulfillment Planning & Orchestration | Consumes approved ServiceNow tickets. Deconstructs requests into sequential execution steps. Coordinates specialized sub-agents following the principle: <i>Right Agent. Right Tool. Right Action.</i>                                               |
| 4. Dynamic Tool & RPA Selection         | Autonomously selects the best fulfillment mechanism:<br>• <b>Direct API:</b> Microsoft Graph (M365 DLs, Mailboxes), Cloud IAM, Intune.<br>• <b>RPA Workflows:</b> Power Automate Desktop or UiPath for legacy ERPs, SAP GUI, and closed web portals. |
| 5. Quasi Real-Time Validation           | Executes post-provisioning state checks against destination systems (e.g., verifying group membership or account unlock flags) before initiating ticket closure.                                                                                     |
| 6. Audit Trail & User Notification      | Maintains an end-to-end audit trail by updating ServiceNow work notes with execution logs and timestamps, then delivers real-time resolution notifications to users in Microsoft Teams.                                                              |

### 3. MAF Specialized Sub-Agents & Tool Plugins

| Specialized Sub-Agent     | Domain & Technology         | Assigned MAF Plugins & Tools                                                |
|---------------------------|-----------------------------|-----------------------------------------------------------------------------|
| Mailbox / DL Agent        | M365 / Exchange Online      | GraphApiPlugin: create_distribution_list, add_members, set_mailbox_quota    |
| Access Provisioning Agent | IAM / SAP ERP / Custom Apps | RPAPLugin (Power Automate / UiPath SAP GUI) & Cloud IAM REST APIs           |
| Account Unlock Agent      | Active Directory / Entra ID | ActiveDirectoryPlugin & GraphApiPlugin: unlock_entra_account, clear_lockout |
| Password Reset Agent      | Active Directory / Entra ID | GraphApiPlugin: reset_password, force_password_change_on_next_login         |
| Software & License Agent  | Intune / SCCM / Portals     | IntunePlugin: assign_managed_app, assign_license_sku, RPA Portal provision  |

### 4. Resilience, Exception Handling & Tier-2 Human Escalation

- **Transient Error Retry:** Automated exponential backoff retry for network or rate-limiting events.
- **RPA Exception Recovery:** In the event of a UI selector timeout, captures error logs and screenshots into ServiceNow.
- **Tier-2 Human Escalation:** When automated resolution cannot proceed safely, reassigns ticket to human service desk with complete diagnostic telemetry.
- **Zero-Trust Security:** Enforces principle of least privilege; specialized sub-agents only access tools within their strict domain.
